

What I need from the senior team

Specific, dated. Each ask has the same shape: **The ask** · **Why I need it** · **What I need from you** · **When**.

If you skim only one section, make it section 1 (Decisions). That's what's actually blocking launch.

Compiled 20 May 2026 by Rishabh.

1. Decisions (only you can decide)

1.1 Default org for the multi-tenant migration

- **The ask:** Confirm that **all existing data** in the current Supabase (every deal, person, fund, note, interaction) should be attributed to a single org named "Valence Growth Partners."
- **Why:** I'm about to add an `org_id` column to every table and back-fill the existing rows. The back-fill assigns every existing row to one owner. Once done, this is hard to undo.
- **What I need from you:** A yes/no on the name. If you'd rather use a different name (e.g. "Valence Growth Partners — London" to leave room for a separate Mumbai entity later), tell me now.
- **When:** Before I run the migration. I will not run it without this confirmation.

1.2 Brand decision: Orbit or ValenceOS?

- **The ask:** Pick the public name for v1.
- **Why:** The OAuth callback URLs, the legal page firm names, the email templates, and the domain all need it. Reversible later but every change after launch is a customer-comms cost.
- **What I need from you:** One word.
- **When:** Before we wire customer-facing communications. ~1 week.

1.3 Launch cohort — single firm or multi-tenant from day 1?

- **The ask:** Decide whether v1 launches as a single-tenant deploy for Valence's internal use, or a multi-tenant SaaS open to two or more firms simultaneously.
- **Why:** Single-tenant cuts ~2 weeks of engineering (no need for the `org_id` migration, RLS rewrite, invite flow). Multi-tenant is the right answer if you want this to be a product, not an internal tool.

- **What I need from you:** A direction.
 - **When:** This week. Drives the next 3 weeks of engineering.
-

2. Credentials I need provisioned

I cannot create any of these on Valence's behalf. They need to be created by someone with billing authority and shared with me.

2.1 Email provider account + key

- **Why:** Sending invites, password resets, allowance notifications, and any other transactional email. Right now we have no way to email a customer anything.
- **What I need:**
 - Pick one: **Resend** (easiest), **Postmark** (best deliverability for transactional), or **AWS SES** (cheapest at scale, more setup).
 - API key for the chosen provider.
 - **Recommendation:** Resend for speed; we can re-evaluate at scale.

2.2 Sentry account + DSN

- **Why:** When a customer hits an error, we need to know about it before they tell us. [src/lib/sentry.js](#) is wired; just needs a DSN.
- **What I need:** A Sentry workspace and the public DSN string.
- **Recommendation:** Sentry's free tier covers us until ~5 firms.

2.3 Product analytics

- **Why:** Understand which features get used vs ignored. Drives what to invest in vs cut.
- **What I need:** Pick **PostHog** (open source, includes session replay) or **Mixpanel** (more polished dashboards, more expensive).
- **Recommendation:** PostHog — free tier is generous, replay is invaluable when a customer says "this is broken" without context.

2.4 Custom domain

- **Why:** [valenceos.vercel.app](#) is fine for the pilot but the team you sell to will Google it before they click. A real domain signals seriousness.
- **What I need:**
 - A subdomain on [valencegrowth.com](#) (e.g. [app.valencegrowth.com](#))

- DNS access (or someone who can add a CNAME on request)
 - **Timeline:** 1 hour from "you have DNS access" to live.
-

3. Sign-offs / approvals

3.1 Counsel review of Terms + Privacy

- **The ask:** Get a lawyer (yours or external) to review the starter Terms of Service and Privacy Policy I've drafted and either approve or rewrite.
- **Why:** Cannot publicly launch without lawyer-reviewed terms. IB firms specifically will ask for a Data Processing Agreement (DPA) before signing — counsel needs to draft that too.
- **What I need:** Confirmation that legal review is in motion, and a rough ETA. Whoever you use, send them the current [/terms](#) and [/privacy](#) pages and ask for a redline.
- **Timeline:** Typically 1–2 weeks of calendar time. Start in parallel with everything else.

3.2 Rotate the leaked Gemini API key

- **The ask:** Go into Google AI Studio, revoke the current [VITE_GEMINI_API_KEY](#), generate a new one, give it to me to set as [GEMINI_API_KEY](#) (server-side env var only — won't leak this time).
 - **Why:** The old key shipped inside every JS bundle deployed to date. Anyone with browser DevTools could lift it and drain the quota. Treat it as **leaked**.
 - **What I need:** A new key, handed to me via a secure channel (1Password / Bitwarden / encrypted note — NOT Slack DM).
 - **When:** This week, ideally today. The cost exposure is real.
-

4. Introductions / people

4.1 First pilot customers

- **The ask:** 1–3 firms you'd be comfortable putting on this as a pilot in the first 30 days.
- **Why:** Real usage from real partners is the only way to find rough edges before they go public.
- **What I need:** Names + introductions. I'll handle the demo,

onboarding, and support myself.

- **Ideal profile:** Mid-size advisory firms, 5–15 partners, India or UK based, English-speaking, already using Google Workspace.

4.2 A lawyer

- **The ask:** A lawyer who's done SaaS terms before. Doesn't need to be expensive — a junior associate at a tech-friendly firm is fine for v1.
- **Why:** §3.1.
- **What I need:** An introduction.

4.3 Whoever handles vendor procurement / business entity stuff

- **The ask:** A specific person who can sign up for Resend, Sentry, PostHog, the domain — and who has authority to put them on a Valence corporate card.
- **Why:** I don't want to be making half a dozen accounts in my personal name and then transferring them.
- **What I need:** An introduction or "yes, ask me directly."

5. Information I'm assuming — please correct if wrong

These are decisions I've made because no one told me otherwise. Push back on any of them.

Assumption	Verify?
The product is called "Orbit" in v1, "ValenceOS" is the working name	■
We're going multi-tenant from day 1, not single-tenant pilot	■
Valence is the operating entity behind v1 (not a separate Orbit Inc.)	■
We're hosting in ap-northeast-1 (Tokyo) Supabase — closest to Mumbai	■
Mumbai + London are the operating offices; no other entities	■
Data residency: customers don't get a choice of region in v1	■

6. Honest read on what each unblocks

So you can prioritise:

If you give me...	...I can ship within	Unblocks
1.1 default org name	24 hours	Multi-tenant migration → auth → onboarding redirect → real launch path
1.2 brand decision	24 hours	All customer-facing copy, OAuth URLs, domain pointing
2.1 email provider key	24 hours after handoff	Transactional emails, allowance warnings, invites
2.4 domain DNS access	1 hour	Customers see a real URL
3.2 rotated Gemini key	1 hour	Removes ongoing key-leakage exposure

7. What I'm doing in the meantime

So you know I'm not blocked on everything:

- Wiring the remaining 7 AI features through the server proxy (the ones still calling Google directly with the leaked key).
- Building the customer-facing settings screens.
- Tightening dark-mode polish and bug fixes.

These don't need any decisions from you.

8. One ask of the senior team itself

When you meet, please appoint **one person** as the point of contact for the items in §1, §2, §3. Right now I'm asking "the senior team" as a group — which means in practice nobody owns any of these. One named person, even just for the duration of getting through this list, makes everything faster.
